The Spatial Reality of Ryan Shtuka: A Fact-Based Deduction

Isolating the Top Probability using Weather, Topography, and the 1:30 AM Revised Timeline

NotebookLM

Baseline Thermodynamics
01:30 AM, Feb 17, 2018

-26°C Temperature

Extreme cold plummets the survival window to mere minutes, severely accelerated by alcohol consumption.

22cm Rapid Snowfall

An immediate natural concealment mechanism blanketing physical evidence within hours.

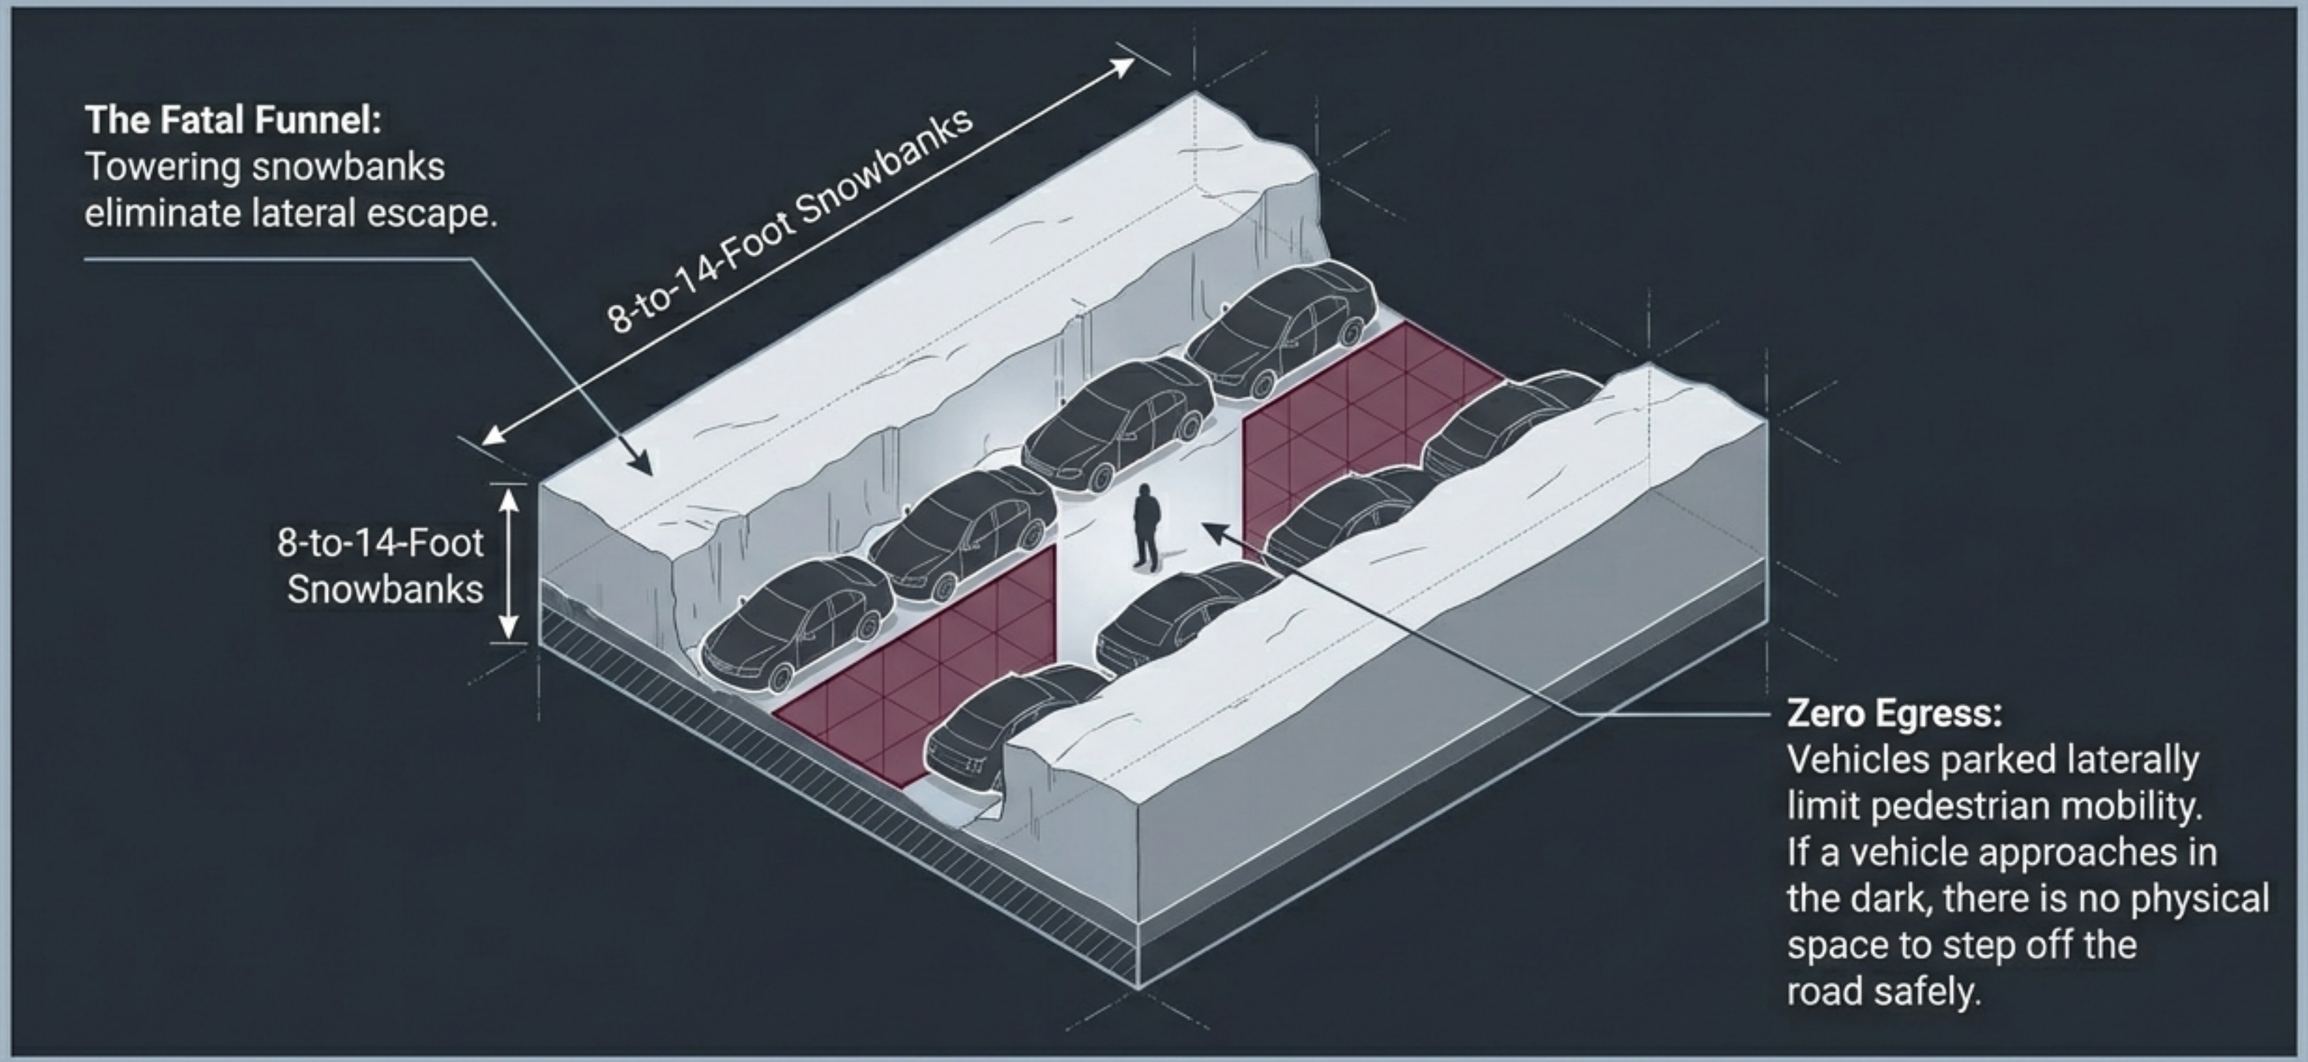

Zero Illumination

Pitch-black conditions. Zero active streetlights along the primary walking route.

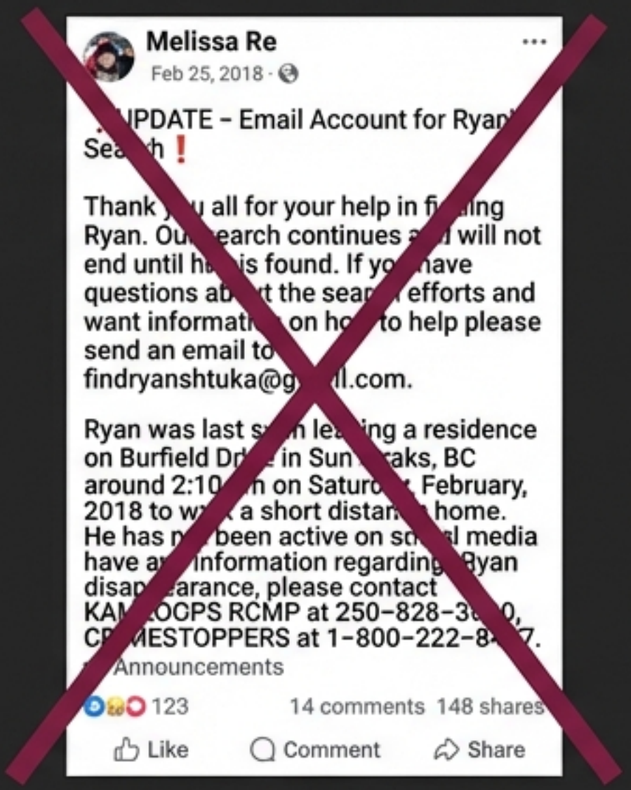

NotebookLM

The Geographic Trap: Burfield Drive

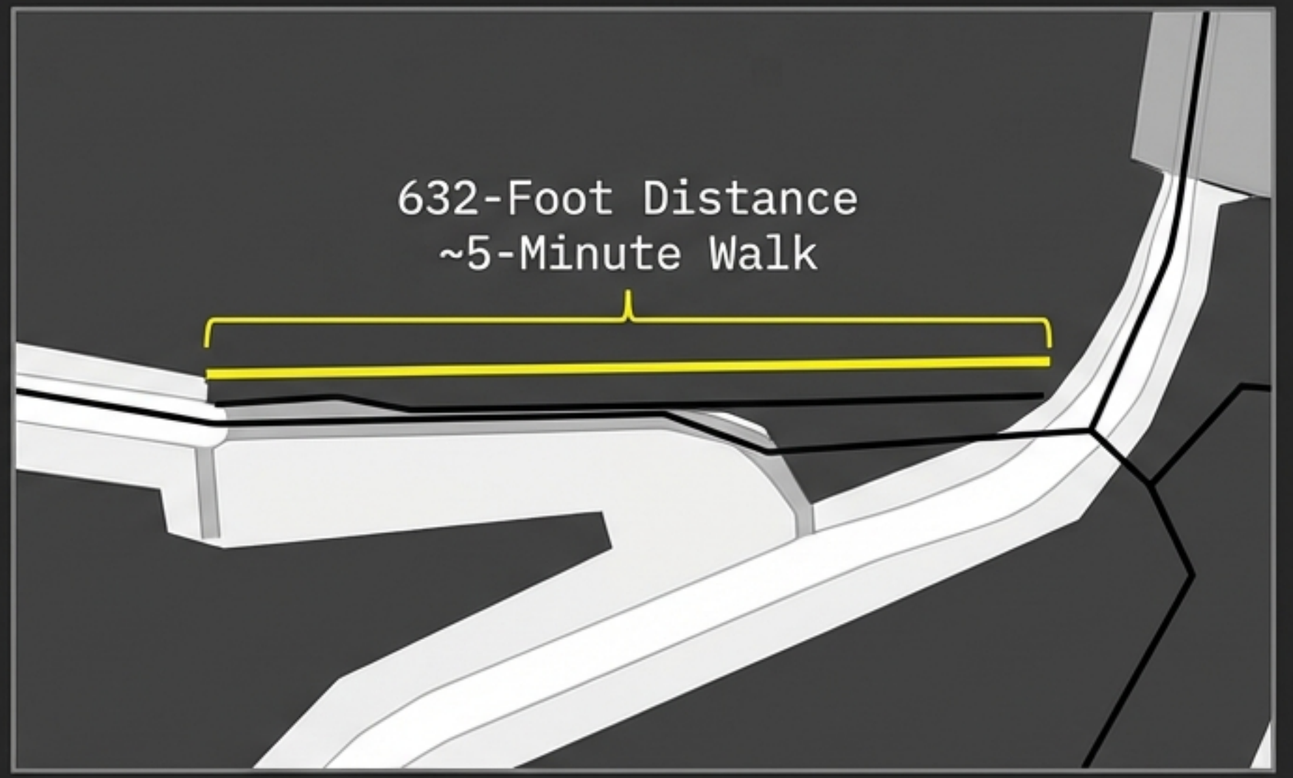

NotebookLM

The Revised Timeline: The 1:30 AM Departure

1:30 AM

1:30 AM: Recovered text message shifts the departure window 40 minutes earlier.

The Disorientation Factor

A roommate departing moments prior turned the wrong way due to zero visibility, highlighting the severe risk of spatial disorientation in these specific weather conditions.

NotebookLM

Systemic Geographical Risks

Delayed Law Enforcement

Zero active local RCMP presence in Sun Peaks. A minimum 45-minute response delay from Kamloops.

Vehicular Threat Matrix

Heavily documented history of impaired driving and hit-and-runs on local mountain roads.

Infrastructure Precedent

A local pedestrian path was specifically constructed in response to a violent 2015 vehicular hit-and-run in the village.

NotebookLM

The Zero Trace Paradox

Immediate Winter Response

Dogs, drones, and infrared sweeps conducted over fresh snow cover.

Post-Thaw Reality

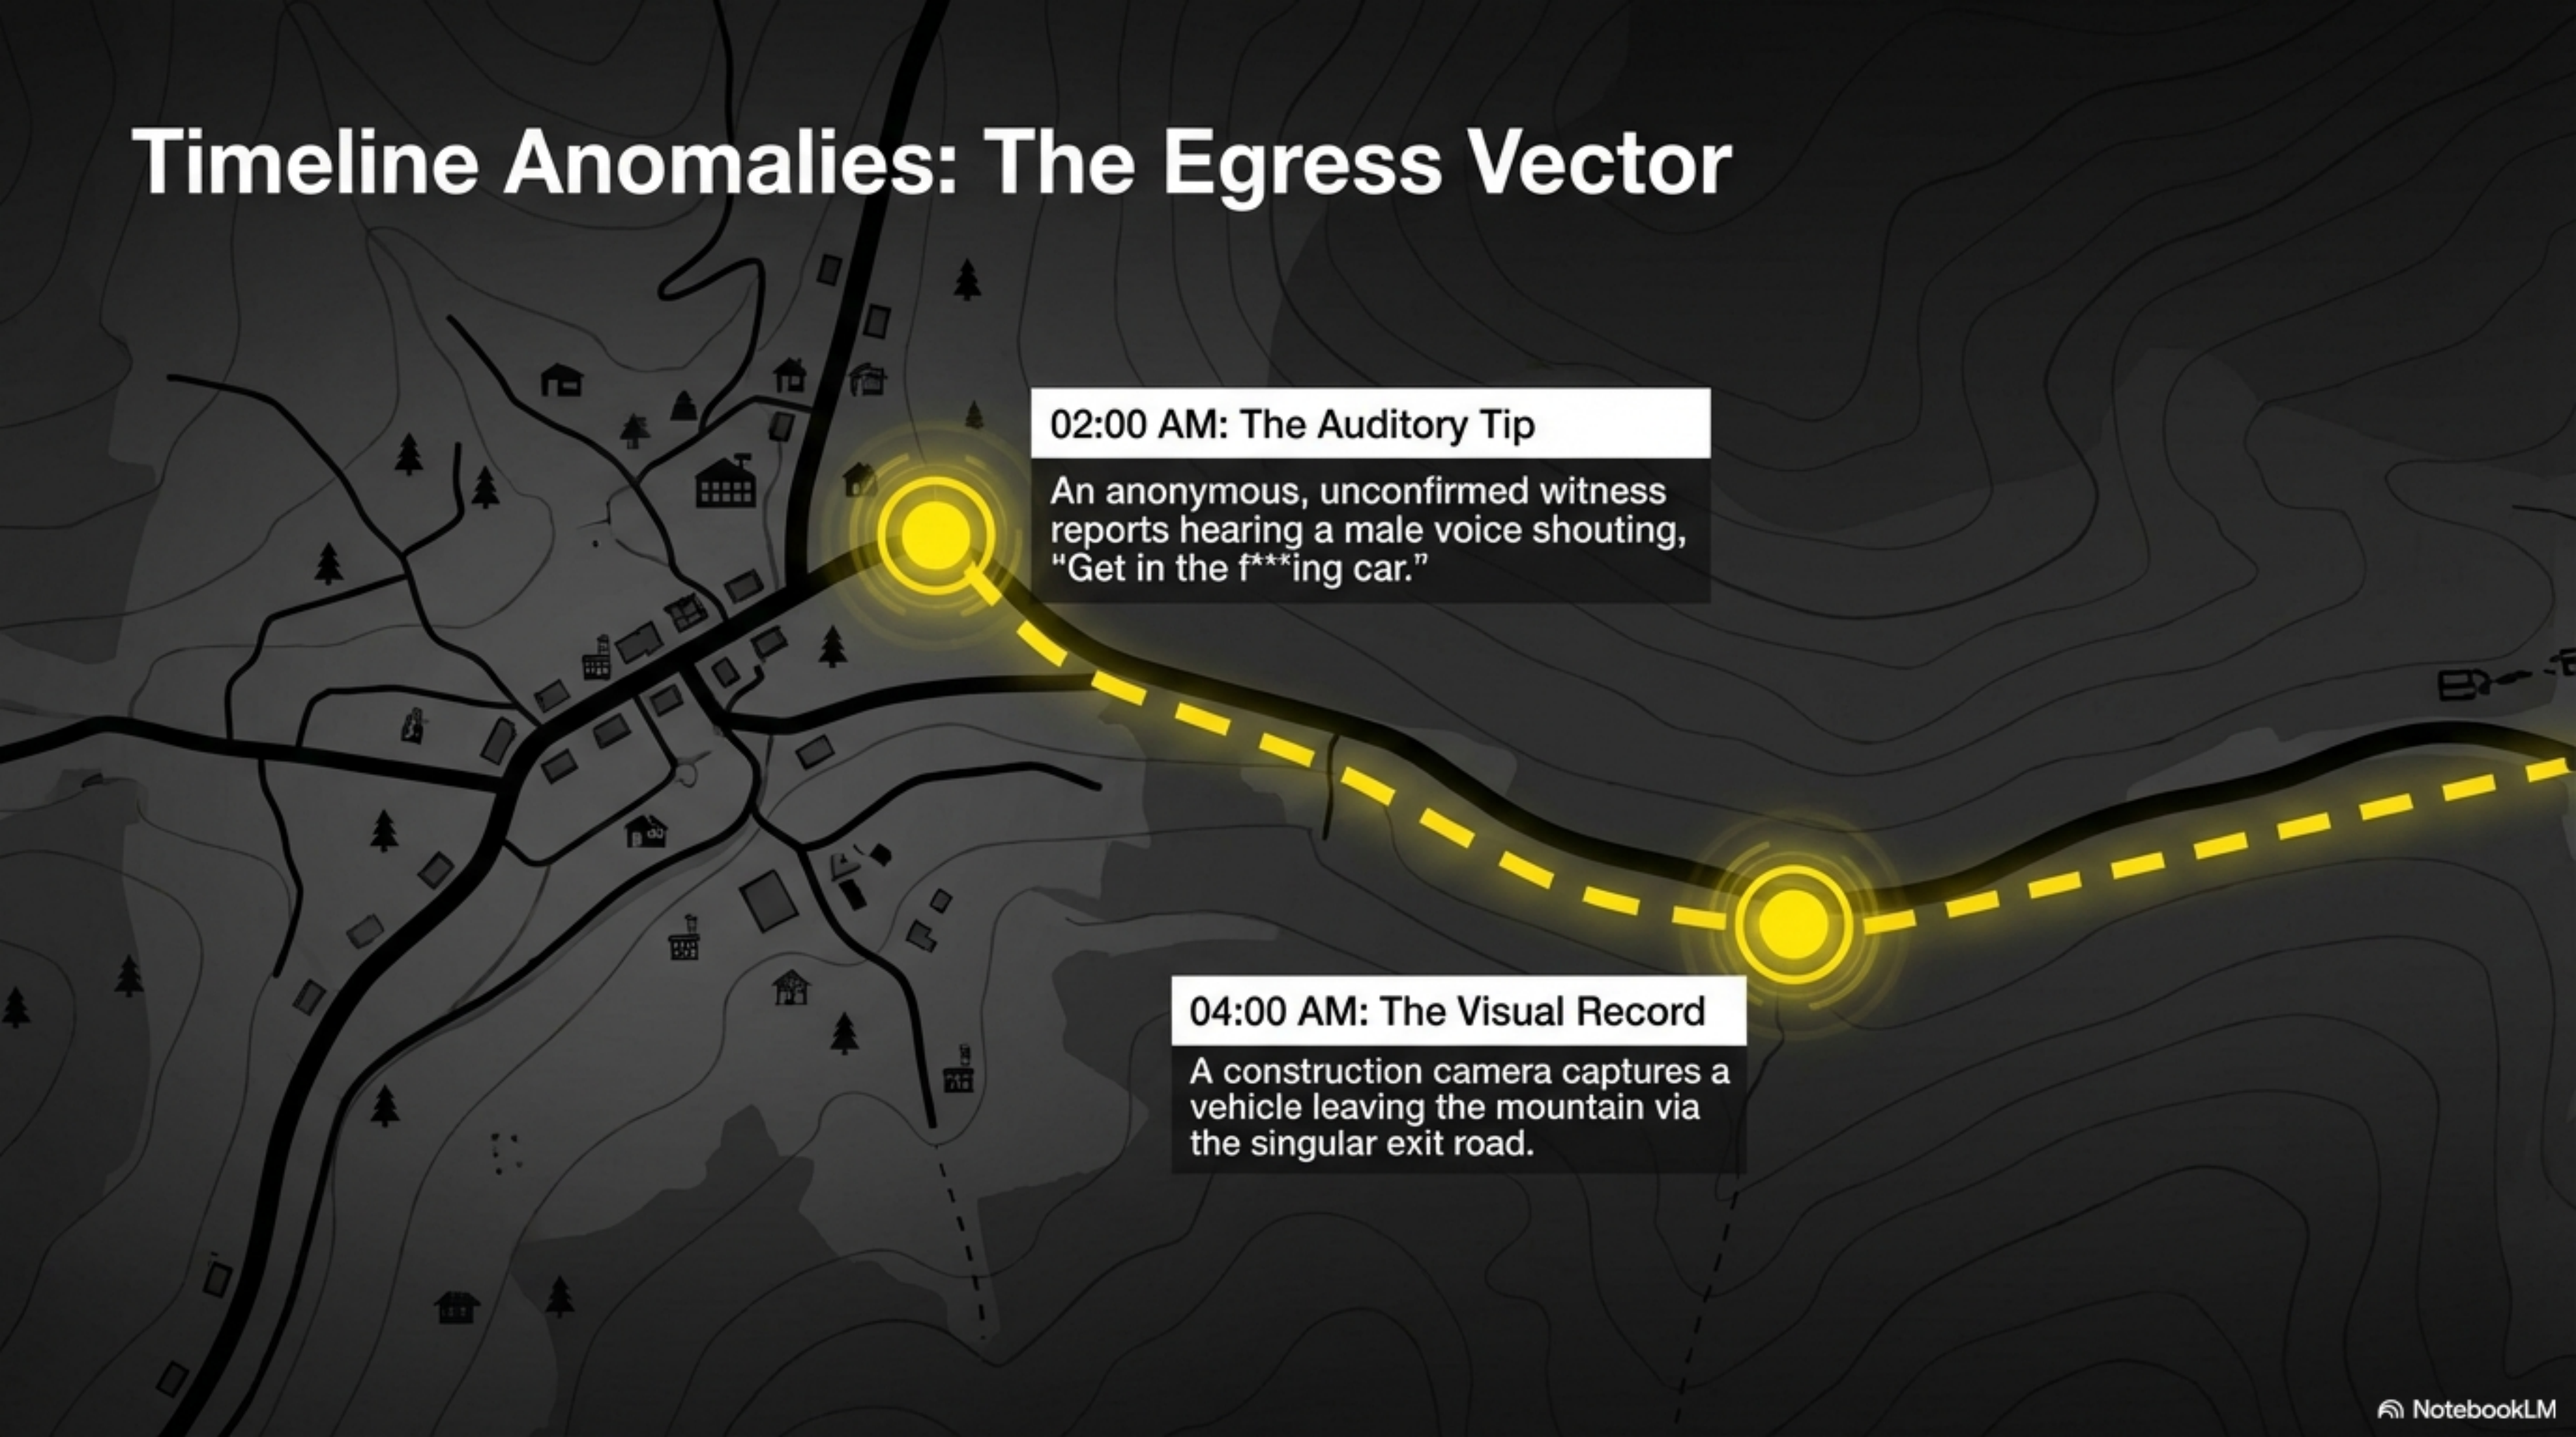

7 years of exhaustive grid searches, brown earth exposure, and aerial LiDAR scans yield absolutely nothing.

The Deduction: A surface-level exposure event is mathematically improbable. Missing artifacts (burgundy hat, blue coat, phone) would have been located. Any valid theory must account for total physical erasure.

NotebookLM

Timeline Anomalies: The Egress Vector

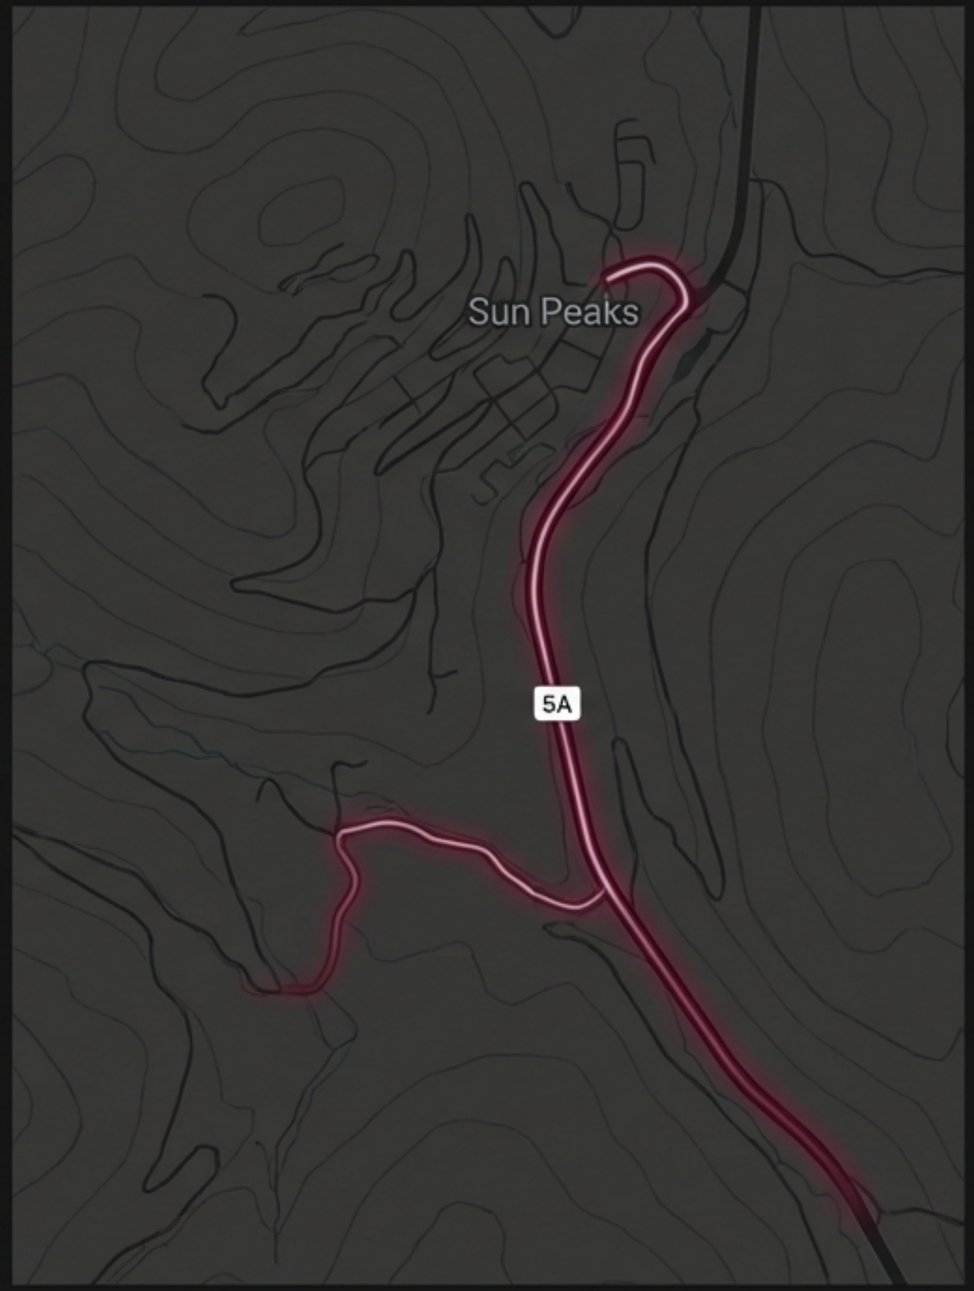

NotebookLM

The Top Probability: Vehicular Strike & Relocation

The Catalyst: 1:30 AM, pitch black, -26°C. Ryan navigates a narrow road with 10ft snowbanks and no escape route amidst high local DUI statistics.

The Event: A driver strikes the pedestrian, panics, and loads the body into a vehicle to conceal the crime.

The Alignment: This is the ONLY theory that perfectly satisfies the Zero Trace Paradox. Removal from the mountain mathematically explains the total absence of personal effects during 7 years of LiDAR and ground searches.

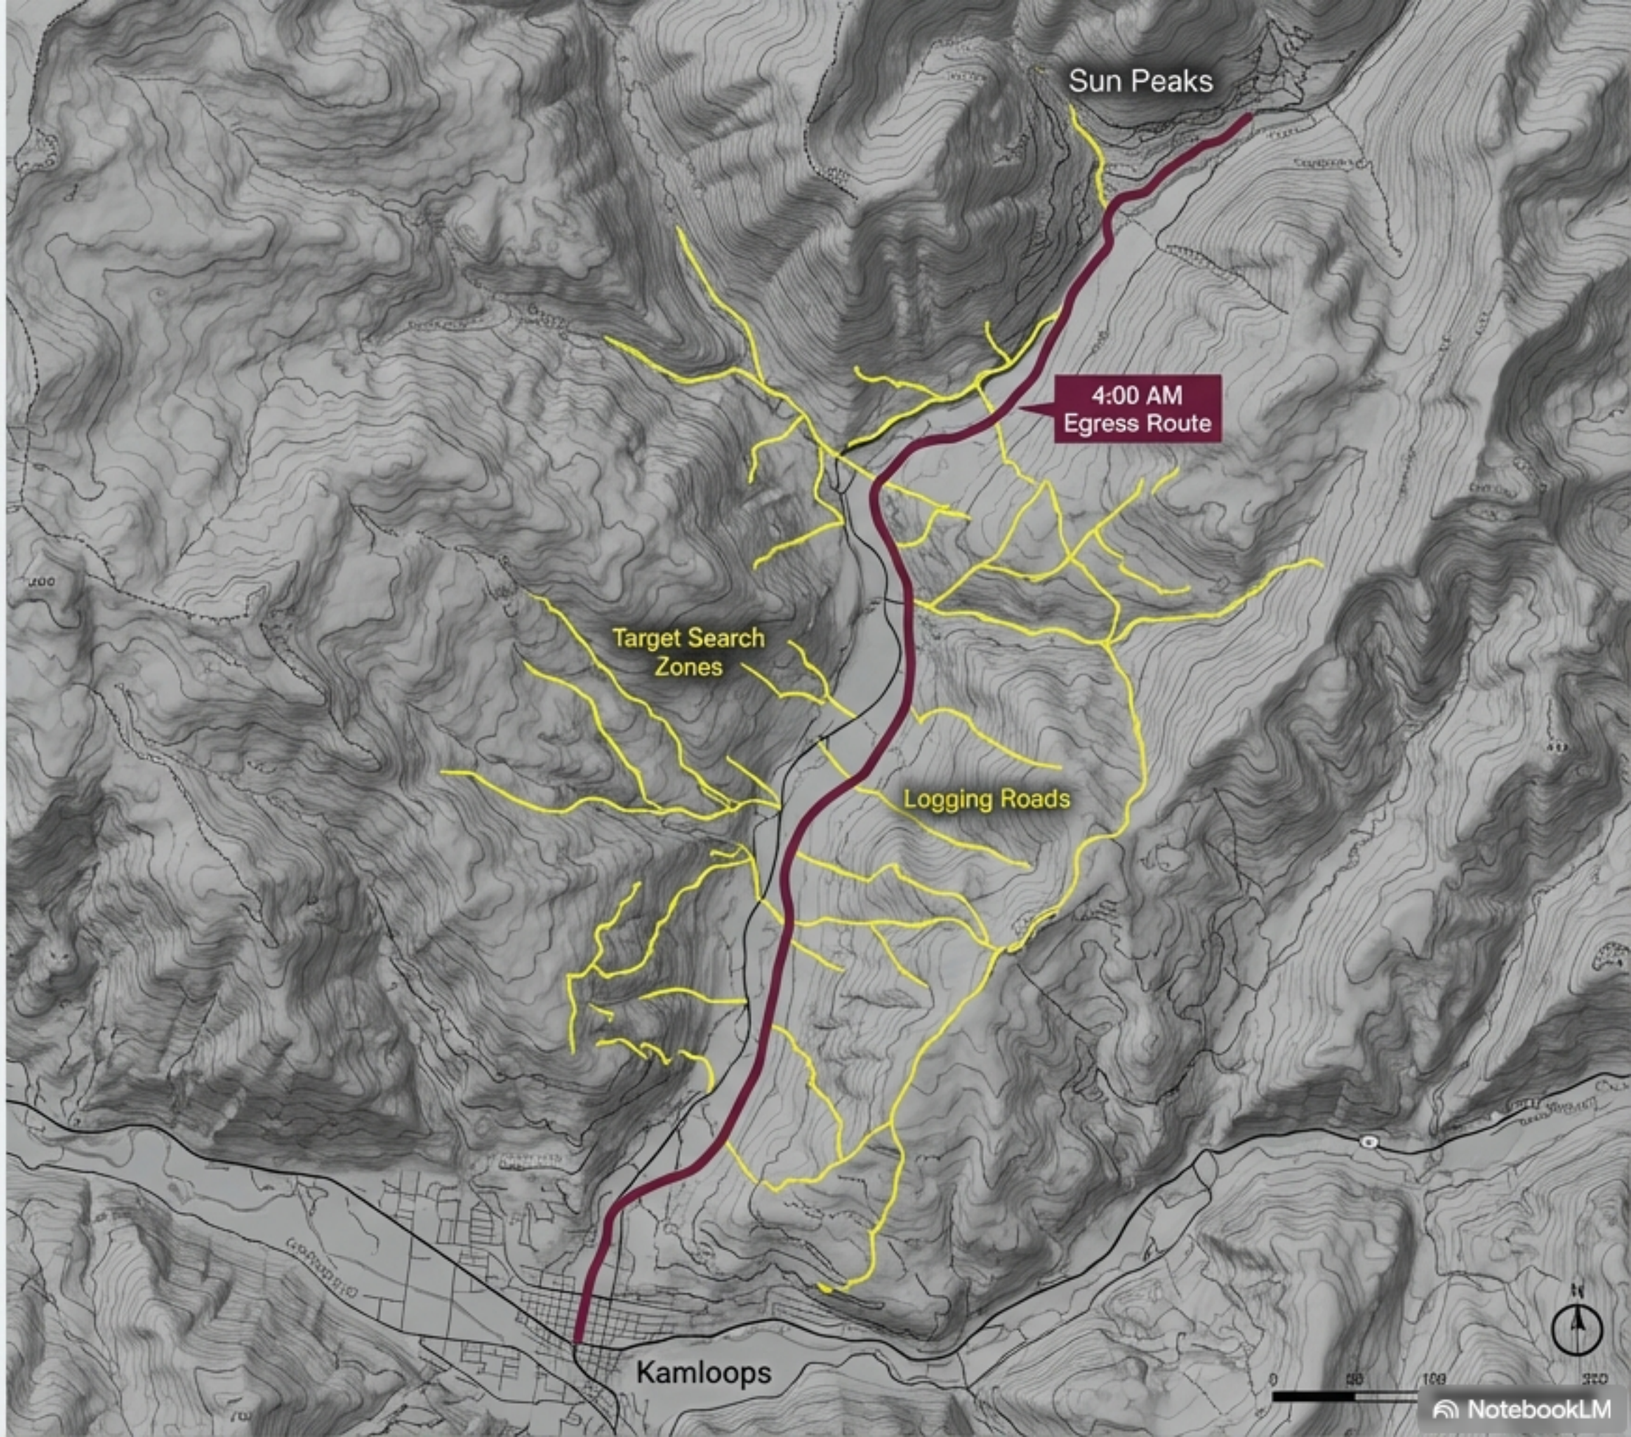

NotebookLM

Macro Spatial Line of Sight: The Escape Vector

Relocation Reality: If removed from the mountain, the primary search matrix shifts entirely to the 45-minute drive down toward Kamloops.

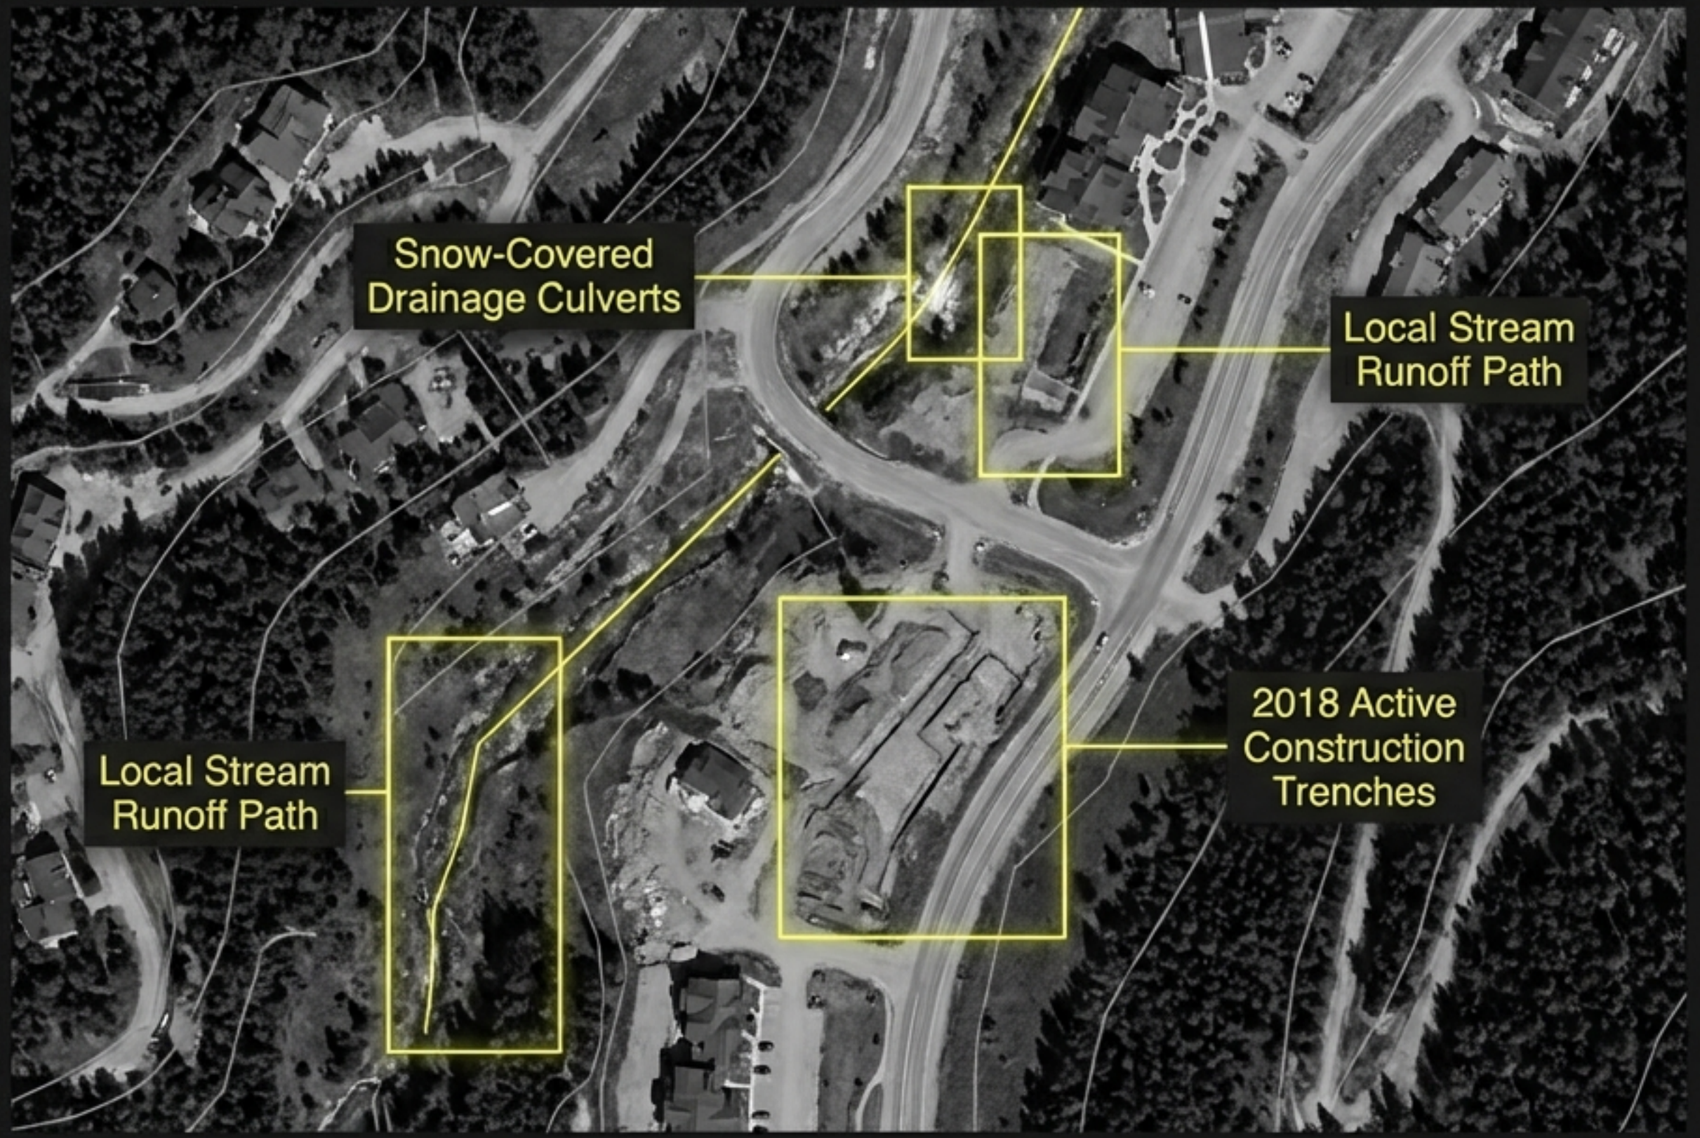

Target Zones: Active logging roads, deep ravines, and pull-outs accessible by a panicked driver navigating a severe winter storm in the dark.

Localized Concealment: The Subterranean Regress

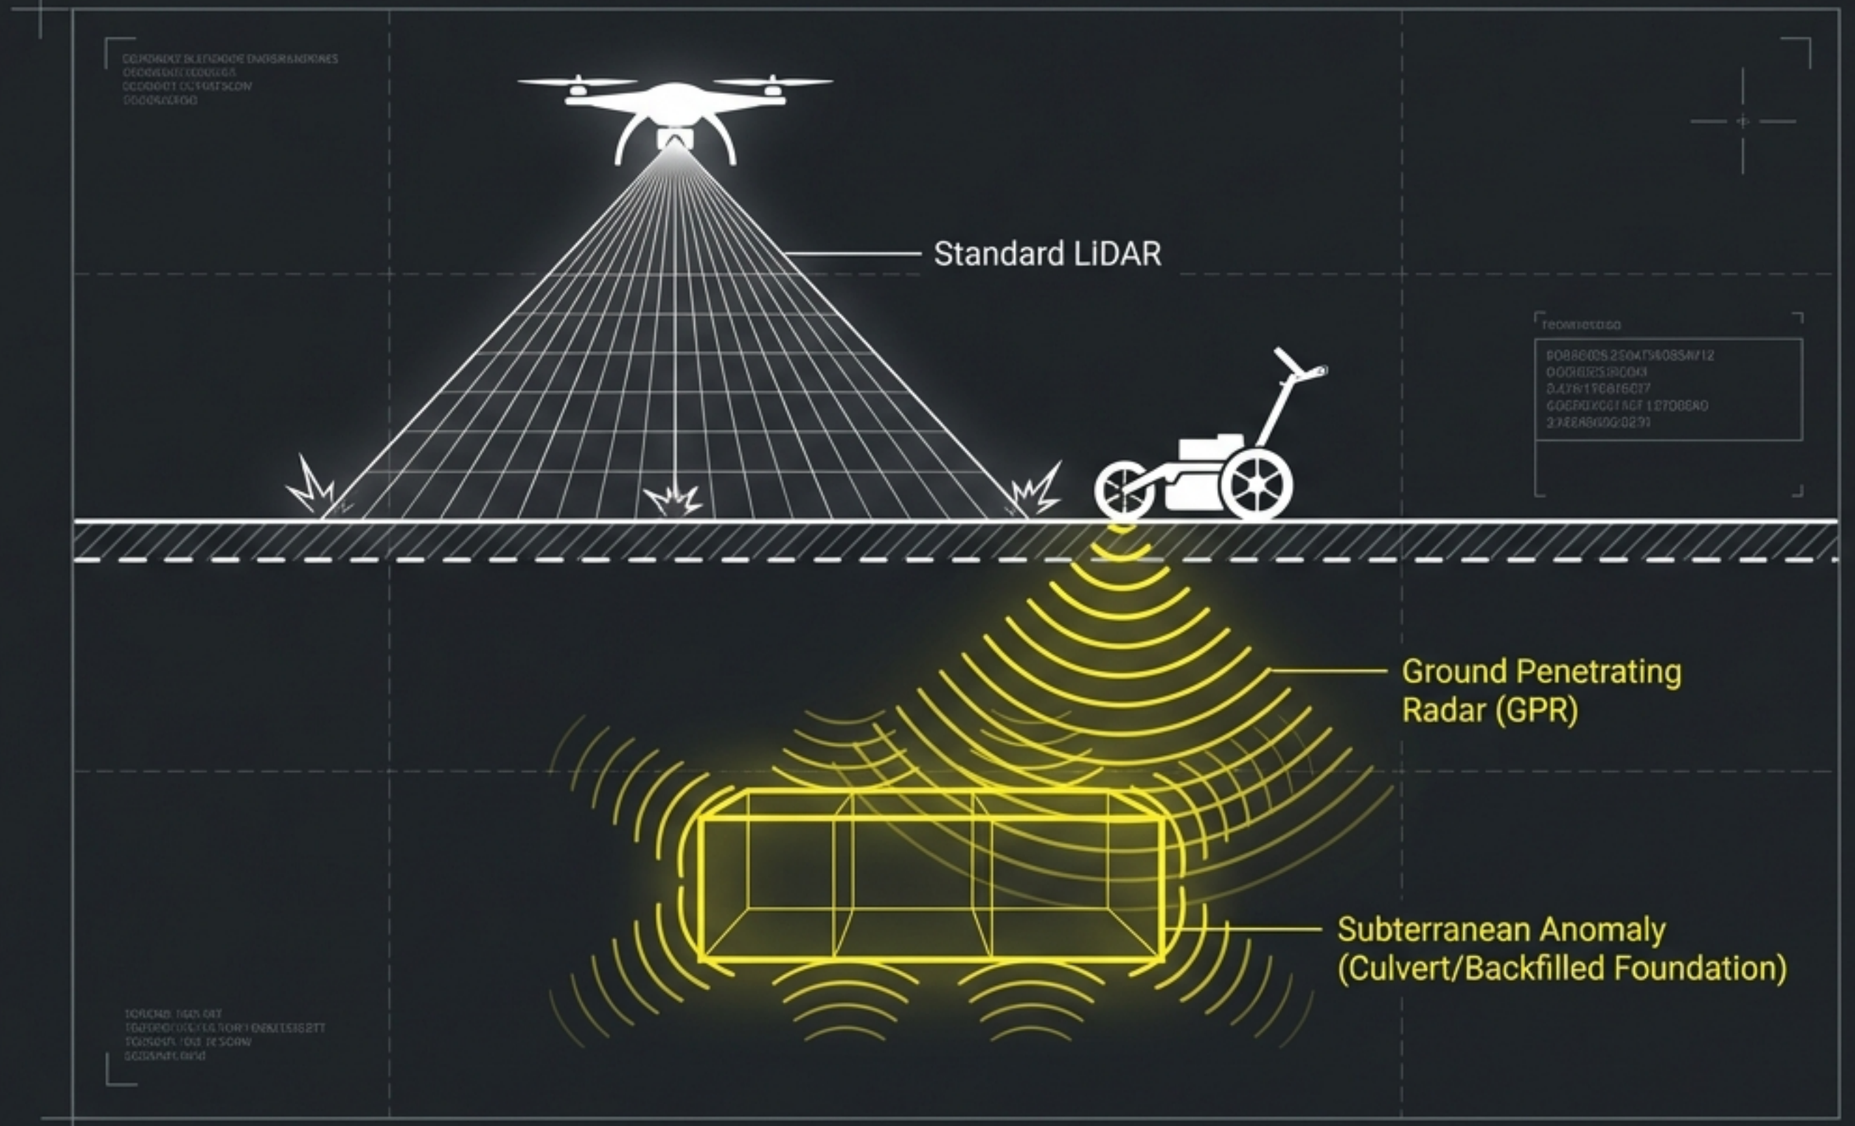

The Secondary Probability: If Ryan succumbed locally, the body is concealed from surface LiDAR via subterranean trapping.

Hazards: Open trenches in 2018 that were subsequently backfilled, deep tree wells, or water egresses washed out by the aggressive spring melt.

NotebookLM

Micro Spatial Line of Sight: Tactical Shift

Exhausted Methods:
Surface grid searches and aerial LiDAR are no longer viable for the localized zone.

Required Technology:
GPR must be deployed exclusively over specific water outlets, subterranean drainage paths, and 2018 construction foundations along the 632-foot walking route.

NotebookLM

Summary of the Deductive Matrix

[1] The Baseline Facts

-26°C
Temperature

22cm
Rapid Snowfall

1:30 AM
Revised Timeline

Fatal funnel topography with zero lateral egress.

→

[2] The Sieve

The Zero Trace Paradox.

7 years of spring thaw, K9 units, and aerial LiDAR confirm surface-level exposure is statistically improbable.

→

[3] The Targets

1. **Vehicular Egress Routes** (Highway 3 5A and connecting logging roads).

2. **Local Subterranean Water Outlets** (via Ground Penetrating Radar).
