Engineering capacity, with an explicit plan

REVVEL GOAP agent operations

A scoped service for repeatable engineering workflows. $2,000-$5,000 per agent/month, subject to agreed scope and service levels.

Start with the work that repeats

Choose one measurable workflow

Examples for pilot discovery: repository hygiene, test triage, research-to-build handoffs, or release preparation. Agree on the accepted output before assigning an agent.

Buy accepted outcomes

Count results and review cost

Track accepted tasks, cycle time, supervision hours, failure recovery, and total cost. Compare the pilot against your existing workflow using the same acceptance criteria.

Make the plan inspectable

Goals / preconditions / actions

The working GOAP console searches a symbolic state space. Every planned action exposes its conditions, effects, role, and cost. The report records what the planner selected.

Coordinate specialist capacity

Role-aware assignments and resource leases

The console allocates actions to compatible agents with capacity constraints. Inspect the assignment board and export it as CSV to review a proposed work split.

Recovery is part of the workflow

Anomalies and escalation are visible

The planner reports awareness checks, predicted execution outcomes, and escalation signals. Production recovery actions and access controls must be validated for each customer environment.

Try the evidence yourself

A working planner, with exportable reports

Open the console, select a scenario, change the world state, and inspect the recomputed plan. This is a product demonstration, not a claim that customer production outcomes have been achieved.

Estimate capacity value

Replace defaults with your measurements

Illustration: 30 task hours/week × 52/12 × 50% automation × $60/hour = $3,900 monthly capacity value. At $2,000/month, estimated net capacity value is $1,900/month before additional costs.

Agree on a bounded pilot

Baseline, scope, acceptance, review

Record baseline effort and failure rate. Choose one workflow. Set integration and data boundaries. Nominate an owner. Define pass/fail criteria, review checkpoints, and the pilot end date.

Price the actual engagement

$2,000-$5,000 per agent/month

Price depends on volume, integrations, support, service levels, and review requirements. Cloud compute and third-party services must be specified in the proposal; no unpriced unlimited usage assumption.

Expand when the numbers support it

Use measured results as the case study

The pilot report should include the baseline, period, sample size, accepted output count, cost, review time, and exceptions. Customer references and production revenue require separate evidence.

Bring one workflow

Discuss a GOAP agent pilot

Request a pilot through github.com/midnghtsapphire/revvel-standards/discussions/18238. Share a non-sensitive workflow summary and acceptance criteria. Calendar booking is unavailable. Try the interactive planner and ROI calculator before the conversation.
